

Moxi Fractional Laser Post Treatment Instructions

- Redness is normal and expected. Redness can persist for up to 7 days depending on the aggressiveness of the treatment.
- Pinpoint bleeding may occur. This can last for a few hours 12 hours depending on the treatment depth and may be isolated to certain treated areas.
- Immediately after treatment, swelling is common and expected. Use of a cold compress or ice packs will help to relieve the swelling to avoid further swelling, you may choose to sleep in an upright position the first night after treatment. The first morning post treatment is when swelling is more prevalent, especially under the eyes. Swelling may last 2 to 4 days, depending on the aggressiveness of the treatment.
- The treatment area may be extremely warm for 12 to 24 hours after the treatment. Cold compresses or ice packs may provide comfort during this time.
- On the 2nd or 3rd day after treatment, you will increasingly notice tiny dark spots and bronzed appearance to the treated skin. This is part of the healing process where treated tissue is working its way out of your body as new fresh skin is regenerated. During this time, your skin will be very dry and have a sandpaper texture and will begin to flake and peel. If the face is treated, it could take 5 to 7 days for the peeling process to be completed. If the neck, chest or anywhere on the body was treated, this process could take up to 2 weeks.
- After the peeling process is complete, your skin will have a rosy, pink glow that will gradually resolve. Your clinician will inform you and advise you of when make up can be used and which kind.

If an antiviral was prescribed for you, continue to take as directed.

Post treatment discomfort may be relieved by over the counter oral pain relievers; i.e. Extra Strength Tylenol.

Itching may be experienced during the healing phase and is completely normal. Oral Benadryl may help itching but can cause drowsiness. DO NOT scratch the treated area as scarring and pigmentation complications can occur.
